Surgical Pathology Cancer Case Summary (Checklist)

*Protocol revision date: January 2004
Applies to invasive carcinomas only
Based on AJCC/UICC TNM, 6th edition*

LIVER: Resection

Patient name:

Surgical pathology number:

Note: Check 1 response unless otherwise indicated.

MACROSCOPIC**Specimen Type**

- Right lobectomy
 Extended right lobectomy
 Medial segmentectomy
 Left lateral segmentectomy
 Total left lobectomy
 Explanted liver
 Other (specify): _____
 Not specified

Focality

- Solitary (specify location): _____
 Multiple (specify location): _____

Tumor Size

- Greatest dimension: ___ cm
 *Additional dimensions: ___ x ___ cm
 Cannot be determined (see Comment)

MICROSCOPIC**Histologic Type**

- Hepatocellular carcinoma
 Fibrolamellar hepatocellular carcinoma variant (specify): _____
 Combined hepatocellular and cholangiocarcinoma
 Cholangiocarcinoma, intrahepatic
 Bile duct cystadenocarcinoma
 Undifferentiated carcinoma
 Other (specify): _____
 Carcinoma, type cannot be determined

2 * Data elements **with asterisks** are **not required** for accreditation purposes for the Commission on Cancer. These elements may be clinically important, but are not yet validated or regularly used in patient management. Alternatively, the necessary data may not be available to the pathologist at the time of pathologic assessment of this specimen.

Histologic Grade

- Not applicable
 GX: Cannot be assessed
 GI: Well differentiated
 GII: Moderately differentiated
 GIII: Poorly differentiated
 GIV: Undifferentiated/anaplastic
 Other (specify): _____

Pathologic Staging (pTNM)Primary Tumor (pT)

- pTX: Cannot be assessed
 pT0: No evidence of primary tumor
 pT1: Solitary tumor with no vascular invasion
 pT2: Solitary tumor with vascular invasion or multiple tumors none more than 5 cm
 pT3: Multiple tumors more than 5 cm or tumor involving a major branch of the portal or hepatic vein(s)
 pT4: Tumor(s) with direct invasion of adjacent organs other than the gallbladder or perforation of visceral peritoneum

Regional Lymph Nodes (pN)

- pNX: Cannot be assessed
 pN0: No regional lymph node metastasis
 pN1: Regional lymph node metastasis
 Specify: Number examined: ____
 Number involved: ____

Distant Metastasis (pM)

- pMX: Cannot be assessed
 pM1: Distant metastasis
 *Specify site(s), if known: _____

* Data elements **with asterisks** are **not required** for accreditation purposes for the Commission on Cancer. These elements may be clinically important, but are not yet validated or regularly used in patient management. Alternatively, the necessary data may not be available to the pathologist at the time of pathologic assessment of this specimen.

Margins (check all that apply)

Parenchymal Margin

- Cannot be assessed
- Uninvolved by invasive carcinoma
Distance of invasive carcinoma from closest margin: ____ mm
Specify margin: _____
- Involved by invasive carcinoma

Bile Duct Margin (Cholangiocarcinoma Only)

- Cannot be assessed
- Uninvolved by invasive carcinoma
 - * Carcinoma in situ absent
 - * Carcinoma in situ present
- Involved by invasive carcinoma

Other Margin

- Specify margin: _____
- Cannot be assessed
 - Uninvolved by invasive carcinoma
 - Involved by invasive carcinoma

***Venous (Large Vessel) Invasion (V)**

- * Absent
- * Present
- * Indeterminate

***Additional Pathologic Findings (check all that apply)**

- * None identified
- * Hepatocellular dysplasia
- * Ductal dysplasia
- * Cirrhosis/fibrosis
- * Iron overload
- * Hepatitis (specify type): _____
- * Other (specify): _____

***Comment(s)**

4 * Data elements **with asterisks** are **not required** for accreditation purposes for the Commission on Cancer. These elements may be clinically important, but are not yet validated or regularly used in patient management. Alternatively, the necessary data may not be available to the pathologist at the time of pathologic assessment of this specimen.

Background Documentation

Protocol revision date: January 2004

I. Cytologic Material

A. Clinical Information

1. Patient identification
 - a. Name
 - b. Identification number
 - c. Age (birth date)
 - d. Sex
2. Responsible physician(s)
3. Date specimen obtained
4. Other clinical information
 - a. Relevant history
 - (1) family history of liver tumors
 - (2) prior surgery for cancer
 - (3) ulcerative colitis
 - (4) viral hepatitis (hepatitis B virus, hepatitis C virus, or unknown type)
 - (5) hemochromatosis
 - (6) cirrhosis
 - (7) bile duct disease (eg, liver-fluke infection)
 - b. Relevant findings (eg, serum alpha-fetoprotein levels, imaging studies)
 - c. Clinical diagnosis
 - d. Procedure (eg, fine-needle aspiration [FNA], other)
 - e. Type of specimen (eg, aspiration)
 - f. Anatomic site(s) of specimen (eg, right/left lobe of liver)

B. Macroscopic Examination

1. Specimen
 - a. Description
 - b. Unfixed/fixed (specify fixative)
 - c. Number of slides received
 - d. Quantity and appearance of fluid specimen
 - e. Other (eg, tissue received for cytologic preparation)
 - f. Results of intraprocedural consultation
2. Material submitted for microscopic evaluation (eg, smear, cytocentrifuge, touch or filter preparation, cell block)
3. Special studies (specify) (eg, immunohistochemical stains, histochemical stains, electron microscopy, flow cytometry, cytogenetic studies)

C. Microscopic Evaluation

1. Adequacy of specimen (if unsatisfactory for evaluation, specify reason)
2. Tumor, if present (Note **A**)
 - a. Histologic type, if possible (Note **B**)
 - b. Other descriptive features (eg, nuclear grade, necrosis, bile production)
3. Additional pathologic findings, if present
4. Comments
 - a. Correlation with intraprocedural consultation, as appropriate
 - b. Correlation with other specimens, as appropriate
 - c. Correlation with clinical information, as appropriate

II. Incisional Biopsy (Any Surgical Approach)

A. Clinical Information

1. Patient identification
 - a. Name
 - b. Identification number
 - c. Age (birth date)
 - d. Sex
2. Responsible physician(s)
3. Date specimen obtained
4. Other clinical information
 - a. Relevant history
 - (1) family history of liver tumors
 - (2) prior surgery for cancer
 - (3) ulcerative colitis
 - (4) viral hepatitis (hepatitis B virus, hepatitis C virus, or unknown type)
 - (5) hemochromatosis
 - (6) cirrhosis
 - (7) bile duct disease (eg, liver-fluke infection)
 - b. Relevant findings (eg, serum alpha-fetoprotein levels, imaging studies)
 - c. Clinical diagnosis
 - d. Procedure (eg, needle biopsy, wedge biopsy)
 - e. Type of specimen(s) (eg, tumor biopsy, random liver)
 - f. Anatomic site(s) of specimen(s) (eg, right/left lobe, adjacent sites)

B. Macroscopic Examination

1. Specimen
 - a. Tissue(s) received
 - b. Unfixed/fixed (specify fixative)
 - c. Size (3 dimensions, if appropriate)
 - d. Number of cores/fragments
 - e. Descriptive features (eg, color, bile stained)
 - f. Orientation, if indicated by surgeon
 - g. Result of intraoperative consultation
2. Tumor, if identifiable
 - a. Size (3 dimensions, if possible)
 - b. Descriptive features (eg, hemorrhage, necrosis, bile)
3. Additional pathologic findings, if identifiable (eg, cirrhosis)
4. Tissue submitted for microscopic evaluation
 - a. Tumor (Note **C**)
 - b. Other lesions (eg, regenerative nodules, cirrhosis)
 - c. Frozen section tissue fragment(s)
5. Special studies (specify) (eg, immunohistochemical stains, histochemical stains, electron microscopy, flow cytometry, cytogenetic studies)

C. Microscopic Evaluation

1. Tumor
 - a. Histologic type (Note **B**)
 - b. Histologic grade (Note **D**)
 - c. Pattern of growth, if appropriate
 - (1) trabecular

- (2) tubular
- (3) solid
- 2. Venous vessel invasion
- 3. Additional pathologic findings, if present
 - a. Benign neoplasms
 - b. Cirrhosis
 - c. Hemosiderosis (hepatocytes vs sinusoidal lining cells)
 - d. Chronic hepatitis
 - e. Liver cell dysplasia
 - f. Other(s)
- 4. Other tissue(s)/organ(s)
- 5. Results/status of special studies (specify)
- 6. Comments
 - a. Correlation with intraoperative consultation, as appropriate
 - b. Correlation with other specimens, as appropriate
 - c. Correlation with clinical information, as appropriate

III. Partial or Complete Hepatectomy

A. Clinical Information

- 1. Patient identification
 - a. Name
 - b. Identification number
 - c. Age (birth date)
 - d. Sex
- 2. Responsible physician(s)
- 3. Date specimen obtained
- 4. Other clinical information
 - a. Relevant history
 - (1) family history of liver tumors
 - (2) prior surgery for cancer
 - (3) ulcerative colitis
 - (4) viral hepatitis (hepatitis B virus, hepatitis C virus, or unknown type)
 - (5) hemochromatosis
 - (6) cirrhosis
 - (7) bile duct disease (eg, liver-fluke infection)
 - b. Relevant findings (eg, serum alpha-fetoprotein levels, imaging studies)
 - c. Clinical diagnosis
 - d. Procedure (eg, left lobectomy, partial hepatectomy, total hepatectomy)
 - e. Operative findings
 - f. Anatomic site (eg, right/left lobe of liver, related sites)

B. Macroscopic Examination

- 1. Specimen
 - a. Tissue(s)/organ(s) received
 - b. Unfixed/fixed (specify fixative)
 - c. Size (3 dimensions)
 - d. Weight
 - e. Descriptive features (external/cut surfaces)
 - f. Orientation, if indicated by surgeon
 - g. Results of intraoperative consultation

2. Tumor(s)
 - a. Number (Note **E**)
 - b. Location
 - c. Size (3 dimensions) for all major tumor nodules
 - d. Circumscribed/infiltrative
 - e. Descriptive features (eg, hemorrhage, necrosis, bile; central scar)
 - f. Extension to adjacent organs/tissues (eg, adrenal gland, diaphragm) (Note **E**)
 - g. Venous vessel invasion (Note **E**)
3. Margins (Note **F**)
4. Pathologic findings in noncancerous liver
 - a. Cirrhosis (type)
 - b. Other(s)
5. Regional lymph nodes (Note **G**)
 - a. Location, if designated
 - b. Number
6. Tissues submitted for microscopic evaluation
 - a. Tumor
 - b. Nodules (Note **H**)
 - c. Margins of resection (Note **F**)
 - d. Non-neoplastic liver
 - e. Portal/hepatic veins
 - f. Porta hepatis
 - g. All lymph nodes
 - h. Other lesions
 - i. Gallbladder, if present
 - j. Other tissues or organs (specify)
 - k. Frozen section tissue fragment(s)
7. Special studies (specify, eg, immunohistochemical stains, histochemical stains, electron microscopy, flow cytometry, cytogenetic studies)

C. Microscopic Evaluation

1. Tumor(s)
 - a. Histologic type (Note **B**)
 - b. Histologic grade (Note **D**)
 - c. Pattern of growth, if appropriate
 - (1) trabecular
 - (2) tubular
 - (3) solid
 - d. Number and location
 - e. Venous vessel invasion
2. Additional pathologic findings, if present (Note **I**)
 - a. Benign tumor
 - b. Cirrhosis (type)
 - c. Hemosiderosis (hepatocellular vs sinusoidal lining cells)
 - d. Portal vein thrombosis
 - e. Liver cell dysplasia
 - f. Hepatitis
 - g. Other(s)
3. Margins (Note **F**)

4. Regional lymph nodes (pN) (Note **E**)
 - a. Number
 - b. Number with metastasis (specify location of nodes with metastasis, if possible)
5. Other tissues/organs (specify)
6. Status/results of special studies (specify)
7. Metastasis to other organ(s) or structure(s)
8. Comments
 - a. Correlation with intraoperative consultation, as appropriate
 - b. Correlation with other specimens, as appropriate
 - c. Correlation with clinical information, as appropriate

Explanatory Notes

A. Application

This protocol applies only to primary carcinomas of the liver (hepatocellular carcinoma [hepatoma] and cholangiocarcinoma). It excludes hepatoblastoma.

B. Histologic Type

The protocol recommends the following modified classification of the World Health Organization (WHO). In the United States, almost 70% of the primary malignant tumors of the liver are hepatocellular carcinomas.¹

WHO Classification of Carcinomas of the Liver (Modified)

Hepatocellular carcinoma

Variant: Fibrolamellar hepatocellular carcinoma

Combined hepatocellular and cholangiocarcinoma

Cholangiocarcinoma, intrahepatic

Bile duct cystadenocarcinoma

Undifferentiated carcinoma

C. Submission of Tissue

For most biopsies, the entire specimen should be submitted for histologic examination. Portions may be retained for specific reasons only if the specimen is of sufficient size that histologic evaluation will not be compromised. In a wedge biopsy, sections should be submitted perpendicular to the capsule.

D. Histologic Grade

Grading of Hepatocellular Carcinoma

The grading system of Edmondson and Steiner is recommended for hepatocellular carcinomas.²

- | | |
|----------|--|
| Grade I | Reserved for those hepatocellular carcinomas where the difference between the tumor cells and hyperplastic liver cells is so minor that a diagnosis of carcinoma rests upon the demonstration of more aggressive growths in other parts of the neoplasm. |
| Grade II | Cells show marked resemblance to normal hepatic cells. Nuclei are larger and more hyperchromatic than normal cells. Cytoplasm is abundant and acidophilic. Cell borders are sharp and clear cut. Acini are |

	frequent and variable in size. Lumina are often filled with bile or protein precipitate.
Grade III	Nuclei are larger and more hyperchromatic than grade II cells. The nuclei occupy a relatively greater proportion of the cell (high N:C ratio). Cytoplasm is granular and acidophilic, but less so than grade II tumors. Acini are less frequent and not as often filled with bile or protein precipitate. More single cell growth in vascular channels is seen than in grade II.
Grade IV	Nuclei are intensely hyperchromatic. Nuclei occupy a high percentage of the cell. Cytoplasm is variable in amount, often scanty. Cytoplasm contains fewer granules. The growth pattern is medullary in character, trabeculae difficult to find, and cell masses seem to lie loosely without cohesion in vascular channels. Only rare acini are seen. Spindle cell areas have been seen in some tumors. Short plump cell forms, resembling "small cell" carcinoma of the lung are seen in some grade IV tumors.

The pathologist should specify the grading system used. The higher the grade, the less the resemblance of the tumor to "normal" liver, and the more obvious its morphologic features are to malignant growth.

Histologic grade has been shown to have a relationship to tumor size, tumor presentation, and metastatic rate.^{3,4} Low histologic grade has been shown to be predictive of disease-free survival, but not of overall actuarial survival.⁵

Grading of Cholangiocarcinoma

For cholangiocarcinomas, definitive criteria for histologic grading have not been established; however the following quantitative grading system based on the proportion of gland formation within the tumor is suggested.

Grade X	Grade cannot be assessed
Grade 1	Well differentiated (more than 95% of tumor composed of glands)
Grade 2	Moderately differentiated (50% to 95% of tumor composed of glands)
Grade 3	Poorly differentiated (5% to 49% of tumor composed of glands)
Grade 4	Undifferentiated (less than 5% of tumor composed of glands)

E. TNM and Stage Groupings

The TNM staging system of the American Joint Committee on Cancer (AJCC) and the International Union Against Cancer (UICC)^{6,7} applies to all primary carcinomas of the liver, including hepatocellular carcinomas, intrahepatic bile duct carcinomas, and mixed tumors. It does not apply to hepatic sarcomas or to metastatic tumors of the liver. The T classification depends on the number of tumor nodules, the size of the largest nodule, and the presence or absence of blood vessel invasion. The TNM classification does not discriminate between multiple independent primary tumors or intra-hepatic metastasis from a single primary hepatic carcinoma. Vascular invasion includes either the gross or the histologic involvement of vessels. Portal vein invasion is an important adverse prognostic factor and should be reported.

By AJCC/UICC convention, the designation “T” refers to a primary tumor that has not been previously treated. The symbol “p” refers to the pathologic classification of the TNM, as opposed to the clinical classification, and is based on gross and microscopic examination. pT entails a resection of the primary tumor or biopsy adequate to evaluate the highest pT category, pN entails removal of nodes adequate to validate lymph node metastasis, and pM implies microscopic examination of distant lesions. Clinical classification (cTNM) is usually carried out by the referring physician before treatment during initial evaluation of the patient or when pathologic classification is not possible.

Pathologic staging is usually performed after surgical resection of the primary tumor. Pathologic staging depends on pathologic documentation of the anatomic extent of disease, whether or not the primary tumor has been completely removed. If a biopsied tumor is not resected for any reason (eg, when technically unfeasible) and if the highest T and N categories or the M1 category of the tumor can be confirmed microscopically, the criteria for pathologic classification and staging have been satisfied without total removal of the primary cancer.

Primary Tumor (T)

- TX Primary tumor cannot be assessed
- T0 No evidence of primary tumor
- T1 Solitary tumor without vascular invasion
- T2 Solitary tumor with vascular invasion; or multiple tumors none more than 5 cm in greatest dimension
- T3 Multiple tumors more than 5 cm in greatest dimension or tumor involving a major branch of the portal or hepatic veins(s)
- T4 Tumor(s) with direct invasion of adjacent organs other than the gallbladder or with perforation of visceral peritoneum.

Regional Lymph Nodes (N)

- NX Regional lymph nodes cannot be assessed
- N0 No regional lymph node metastasis
- N1 Regional lymph node metastasis

Distant Metastasis (M)

- MX Distant metastasis cannot be assessed
- M0 No distant metastasis
- M1 Distant metastasis

Stage Groupings

Stage I	T1	N0	M0
Stage II	T2	N0	M0
Stage IIIA	T3	N0	M0
Stage IIIB	T4	N0	M0
Stage IIIC	Any T	N1	M0
Stage IV	Any T	Any N	M1

TNM Descriptors

For identification of special cases of TNM or pTNM classifications, the “m” suffix and “y,” “r,” and “a” prefixes are used. Although they do not affect the stage grouping, they indicate cases needing separate analysis.

The “m” suffix indicates the presence of multiple primary tumors in a single site and is recorded in parentheses: pT(m)NM.

The “y” prefix indicates those cases in which classification is performed during or following initial multimodality therapy (ie, neoadjuvant chemotherapy, radiation therapy, or both chemotherapy and radiation therapy). The cTNM or pTNM category is identified by a “y” prefix. The ycTNM or ypTNM categorizes the extent of tumor actually present at the time of that examination. The “y” categorization is not an estimate of tumor prior to multimodality therapy (ie, before initiation of neoadjuvant therapy).

The “r” prefix indicates a recurrent tumor when staged after a documented disease-free interval, and is identified by the “r” prefix: rTNM.

The “a” prefix designates the stage determined at autopsy: aTNM.

Additional DescriptorsResidual Tumor (R)

Tumor remaining in a patient after therapy with curative intent (eg, surgical resection for cure) is categorized by a system known as R classification, shown below.

RX	Presence of residual tumor cannot be assessed
R0	No residual tumor
R1	Microscopic residual tumor
R2	Macroscopic residual tumor

For the surgeon, the R classification may be useful to indicate the known or assumed status of the completeness of a surgical excision. For the pathologist, the R classification is relevant to the status of the margins of a surgical resection specimen. That is, tumor involving the resection margin on pathologic examination may be assumed to correspond to residual tumor in the patient and may be classified as macroscopic or microscopic according to the findings at the specimen margin(s).

Vessel Invasion

By AJCC/UICC convention, vessel invasion (lymphatic or venous) does not affect the T category indicating local extent of tumor unless specifically included in the definition of a T category. In all other cases, lymphatic and venous invasion by tumor are coded separately as follows.

Lymphatic Vessel Invasion (L)

LX	Lymphatic vessel invasion cannot be assessed
L0	No lymphatic vessel invasion
L1	Lymphatic vessel invasion

Venous Invasion (V)

- VX Venous invasion cannot be assessed
V0 No venous invasion
V1 Microscopic venous invasion
V2 Macroscopic venous invasion

F. Margins

The evaluation of margins for total or partial hepatectomy specimens depends on the method and extent of resection. It is recommended that the surgeon be consulted to determine the critical foci within the margins that require microscopic evaluation. The transection margin of a partial hepatectomy may be large, rendering it impractical for complete examination. In this setting, grossly positive margins should be microscopically confirmed and documented. If the margins are grossly free of tumor, judicious sampling of the cut surface in the region closest to the nearest identified tumor nodule is indicated. In selected cases, adequate random sampling of the cut surface may be sufficient. In cases of cholangiocarcinoma, the histologic examination of the bile ducts at the cut margin is recommended to evaluate the lining epithelium for in situ carcinoma or dysplasia. If the neoplasm is found near the surgical margin, the distance from the margin should be reported. For multiple tumors, the distance from the nearest tumor should be reported.

G. Lymph Nodes

Histologic examination of a regional lymphadenectomy specimen usually involves examination of 3 or more lymph nodes. The regional lymph nodes of the hepatic region include the hilar, hepatoduodenal ligament, and caval lymph nodes. Nodal involvement of the inferior phrenic lymph nodes or other lymph nodes distal to the hilar, hepatoduodenal ligament, and caval lymph nodes are considered as distant metastasis (pM1).

H. Histologic Sampling

Sections should be prepared from each major tumor nodule with representative sampling of smaller nodules, if macroscopically different in appearance.

I. Additional Pathologic Findings

Cirrhosis should be specifically reported since it has an adverse effect on outcome. Specific types of underlying disease, such as viral hepatitis or hemochromatosis, should be separately evaluated and graded, if appropriate.
